

# Logosol Motion Control Node LS-170F

Doc #712170002 / Rev. B, 10/29/2004

## Features

- ❑ Encoders supported
  - Differential
  - Single ended
- ❑ SERVO AMPLIFIER interface
  - $\pm 10V$  differential analog output
  - AMPLIFIER FAULT input
  - AMPLIFIER ENABLE output
- ❑ Path point buffer for coordinated motion control
- ❑ 30/60/120 Hz rate between the points
- ❑ Absolute and relative moves
- ❑ Feedback loss protection
- ❑ 32-bit position, velocity, acceleration, 16-bit PID filter gain values
- ❑ Hardware Emergency Stop input
- ❑ Forward and reverse over travel inputs
- ❑ Communication speed 19.2 - 115.2 KBps
- ❑ Servo rate 2 KHz
- ❑ Encoder transition rate up to 5MHz

## Description

LS-170F is a single-axis node supporting **coordinated motion control** of several motors with  $\pm 10V$  differential analog output, designed for applications using external servo amplifiers. Up to 32 motion control nodes can be controlled over a multi-drop full duplex RS-485 network in a distributed motion control environment. Standard RJ-45 connectors and commercially available cables are used for daisy chaining of the modules. LS-170F is equipped with various safety features such as an over travel inputs, STOP input, and encoder presence control.

## TECHNICAL SPECIFICATIONS rated at 25°C ambient, POWER (+)=24VDC

POWER SUPPLY VOLTAGE	18 to 32V DC, 35V Absolute Maximum
SERVO RATE	0.512 msec
SERIAL BAUD RATE	19.2 – 115.2 Kbps (Faster communication rates are possible at lower servo rates)
AMPLIFIER INTERFACE OUTPUTS: Vout(+), Vout(-) Voltage Resolution Adjustments ENABLE (EN)	Differential output 0 ÷ ±10V 11bit 0 ÷ ±11V max output voltage, ±150mV offset Programmable enable output, I max=5mA NPN open collector mode: Max=32V PNP open collector mode: HI min=3.5V
INPUTS: FAULT IN	Programmable input terminator connected to GND or +5V LO min=-0.5V<LO< 1.5V; 3.5V <HI max =6V, I max=1mA
LIMIT INPUTS	LO min=-0.5V<LO< 1.5V; 3.5V <HI max =6V, I max=1mA
STP IN	LO min=-0.5V<LO< 1.5V; 3.5V <HI max =30V, I max=1mA
ENCODER INPUTS	Quadrature with index (Differential or Single Ended) TTL with 2K2 pull-up to 5V
LEDS ORANGE GREEN	Power 'ok' (ORANGE and GREEN leds are ON when the Power Servo 'on' is 'OK' and the device is not initialized)
THERMAL REQUIREMENTS Storage temperature range Operating temperature range	-30 to +85 °C 0 to 45 °C
MECHANICAL Size Weight	L=5.00", H=3.30", D=0.85" 0.55lb. (250gr.)
Sensor +5V Max current	200mA
Encoder +5V Max current	600mA
MATING CONNECTORS Power supply Stop Input Encoder and Limit inputs Amplifier interface Communication	2 x Phoenix MSTB 2.5/2-ST-5.08 Molex 22-01-3027 housing with 08-50-0114 pins (2 pcs.) HD-Sub 15pin Male connector 6 pin RJ-45 side entry connector 8 pin RJ-45 side entry connector

## SAMPLE APPLICATION

## LOGOSOL LS-170F QUICK START GUIDE

### Hardware Setup

Connect power supply to LS-170F.\*

Connect your servo amplifier, encoder, and any other device you may have.

Connect RS-232 adapter and RJ-45 network cable between LS-170F and host computer.

### Software Installation

1. Installation and using Logosol Distributed Control Network Utility

#### A. Installation

Insert the Logosol Distributed Control Network Utility installation disk into the floppy drive.

Select Run from the Windows 95/98/NT Start menu.

Type a:\dcnsetup and then click OK (a: represents the drive letter).

The installation wizard will guide you through the setup process.

#### B. Initial Connection to the Host

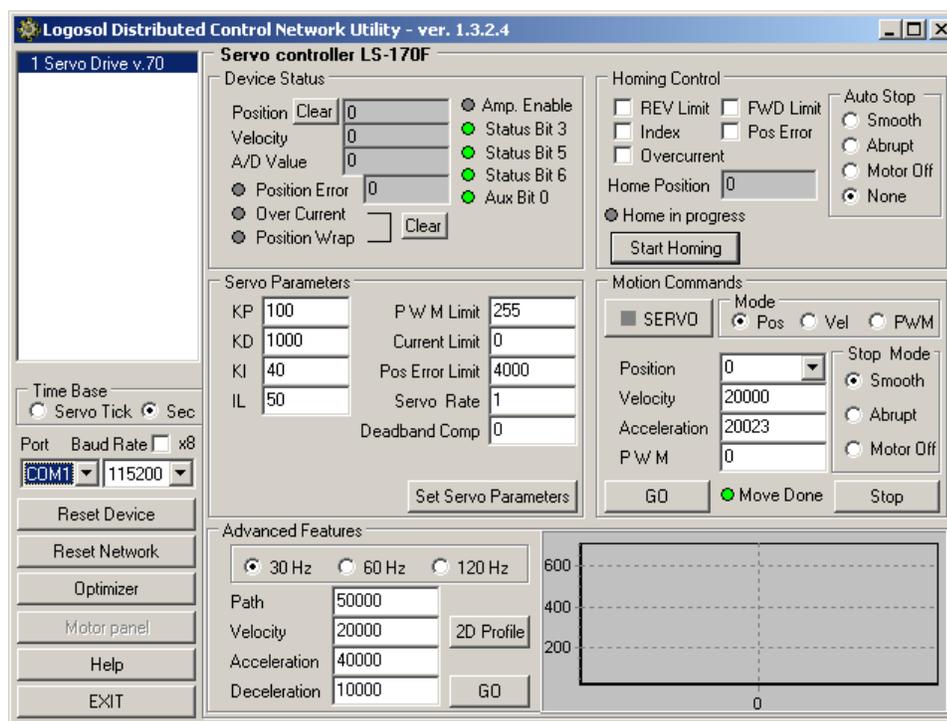

Turn on the power supply.

Run the Logosol Distributed Control Network Utility.

Choose the proper COM port

Click "SERVO" button.

Click "GO" button. The motor should rotate slowly in positive direction. Click "Stop" to interrupt the motion. More information about using LDCN utility is available in LDCN Help.

\* When installing multiple drives, each drive should have its own twisted pair cable running to terminals of the power supply. Don't "daisy-chain" cables from one drive to the next. This will aggravate cable noise and cause the noise from one drives to add to each other. The "star"-wiring configuration will minimize wiring noise.

## LS-170F ARCHITECTURE

### Overview

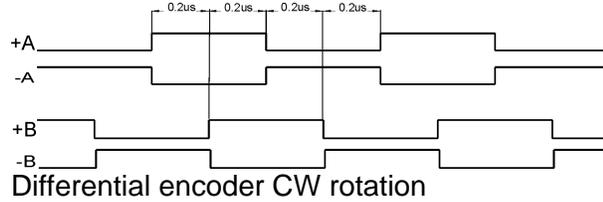

The LS-170F motion control node is a highly integrated module including a motion controller, differential analog voltage output, serial communication interface, incremental encoder interface with limit inputs. The motion control node is designed so that up to 32 controllers can be daisy-chained and connected directly to a single standard serial port (RS-232 adapter may be necessary).

Functional Diagram

## ENCODER INTERFACE

LS-170F is designed to work with quadrature incremental encoder. Both differential and single-ended (non-differential) encoder types may be used. Because of that LS-170F encoder inputs are designed with two separate receivers for each phase instead with one differential.

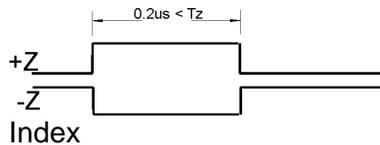

Using encoders with differential wiring is highly recommended because of the better noise immunity. In addition, with differential encoder LS-170F provides protection against motor windup caused by missing or broken encoder wire.

The presence of all encoder signals is controlled by dedicated hardware logic.

Encoder modes:

Mode switches		Encoder mode
Sw3	Sw4	
OFF	OFF	Differential encoder
ON	OFF	Single-ended encoder
OFF	ON	Reserved
ON	ON	Reserved

Index is used for homing (refer to “Set Homing Mode” command in “Command description” section in this document). When homing any index pulse longer than 0.2uS will be detected.

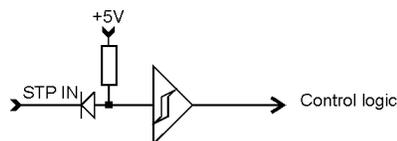

To capture home position with zero error the encoder speed **must be less than 50000 counts/sec.**

## STOP IN

If STOP IN is open:

- ENABLE (EN) output will be open;
- $V_{out(+)} = V_{out(-)} = 0V \pm \text{OFFSET}$ .

For normal operation STOP IN should be LOW.

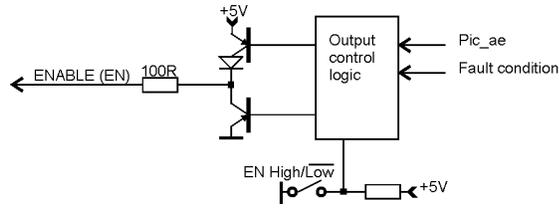

# Logosol Motion Control Node LS-170F

Doc #712170002 / Rev. B, 10/29/2004

**AMPLIFIER INTERFACE** - input/output signals for Servo Amplifier control.

**ENABLE (EN)** – enable/disable control output for the external servo amplifier.

If → EN Hi/Low (Sw8) = OFF the active output level is LOW (NPN open collector mode).

If → EN Hi/Low (Sw8) = ON the active output level is HIGH (PNP open collector mode).

ENABLE (EN) output is SET by:

- Pic\_ae bit from *Stop command* (refer to *Command Description* section in this document)

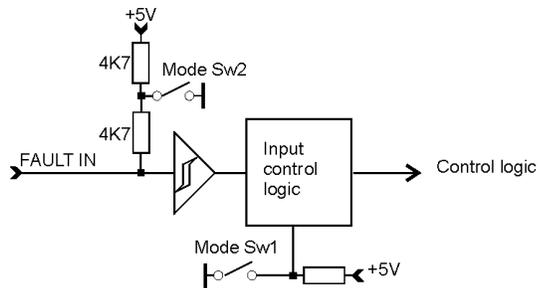

And RESET if:

- STP IN is open;
- One or more Encoder wires are disconnected when Differential encoder mode is used;
- Position error is greater than Position Error Limit;
- FAULT IN is in fault state.

**FAULT IN** – Servo Amplifier status input.

Active level and termination can be selected using DIP-switches.

Mode Sw1	Mode Sw2	Input resistor	Fault when:
OFF	OFF	Pull-up	Low (no fault when FAULT IN is open)
ON	OFF	Pull-up	High (fault when FAULT IN is open)
OFF	ON	Pull-down	Low (fault when FAULT IN is open)
ON	ON	Pull-down	High (no fault when FAULT IN is open)

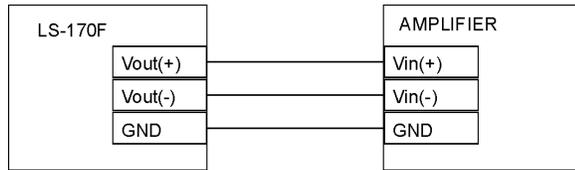

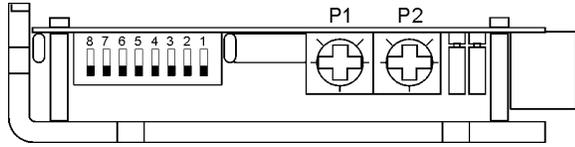

**FAULT IN time-out** - 0.5sec after ENABLE (EN) output is SET.

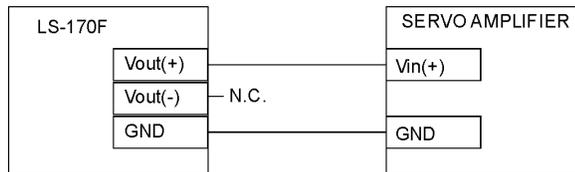

**Vout(+), Vout(-)** – Analog output for servo amplifier control.

Output voltage adjustment – P2 Fully CW =  $\pm 11V$  max per output ( $\pm 22V$  differential).

Offset adjustment – P1  $\pm 150mV$  ( $\pm 300mV$  differential) approximately.

Differential Analog Input Connection. Differential output voltage range  $\pm 20V$ .

Single-Ended Analog Input Connection. Output voltage range  $\pm 10V$ .

## SERIAL COMMAND INTERFACE

Serial communication with the LS-170F drives adheres to a full-duplex (4 wire) 8 bit asynchronous protocol with one start bit, followed by 8 data bits (lsb first), followed by a single stop bit.

The communication protocol of the LS-170F also supports a full-duplex multi-drop RS-485 interface that allows multiple LS-170F motion control nodes to be controlled over a single RS-485 port. In this case, the host sends commands over its RS-485 transmit line and receives all status data back over the shared RS-485 receive line.

The command protocol is a strict master/slave protocol in which the host master sends a command packet over the command line to a specific LS-170F slave. The data are stored in the buffer of the LS-170F until the end of the current servo cycle (0.512 msec max.) and then the command is executed. The servo drive then sends back a status packet. Typically, the host does not send another command until a status packet has been received to insure that it does not overwrite any previous command data still in use.

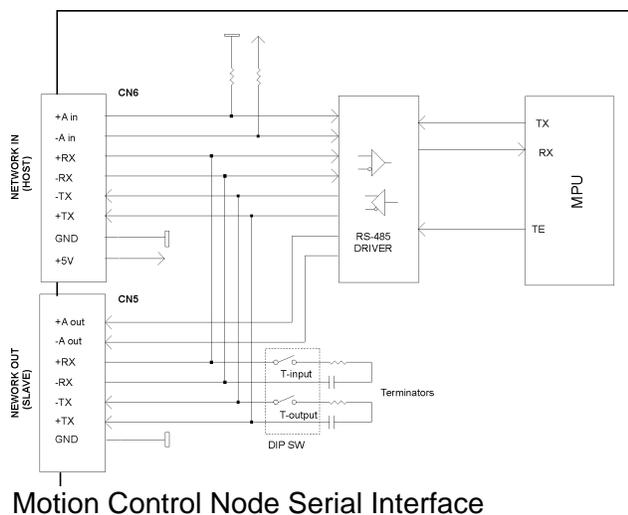

Each command packet consists of:

- Header byte (0xAA)*
- Address byte - individual or group (0x00 - 0xFF)*
- Command byte*
- 0 - 15 data bytes*
- Checksum byte*

The command byte is divided into upper and lower nibbles: the lower nibble is the command value; the upper nibble is the number of additional data bytes, which will follow the command byte. The checksum byte is 8 bits sum of the address byte, the command byte and the data bytes. The number of data bytes depends on the particular command chosen. After a command is issued, the corresponding controller will send back a status packet consisting of:

*Status byte*  
*0-19 optional bytes of status data*  
*Checksum byte*

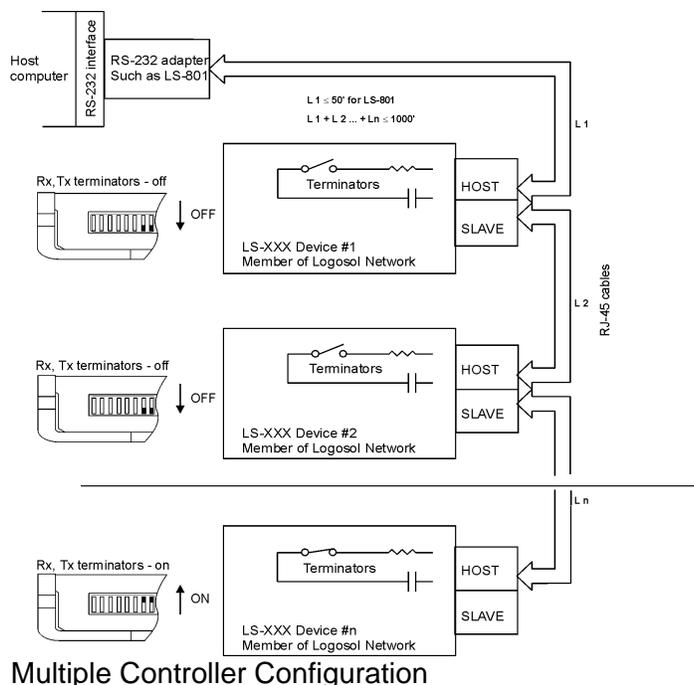

The status byte contains basic status information about the LS-170F, including a checksum error flag for the command just received. The optional data bytes may include data such as the position, velocity, etc. and are programmable by the host. The checksum byte is the 8-bit sum of the status byte and the additional optional status data bytes. The transmission of all 16-bit and 32-bit data is always with the least significant byte first.

## ADDRESSING

In daisy chain mode the host dynamically sets the address of each LS-170F with the aid of the daisy-chained *A in* and *A out* lines. This allows additional LS-170F controllers to be added to an RS-485 network with no hardware changes. *A in* of the first LS-170F is pulled low, its communication is enabled and the default address is 0x00. When the *Set Address* command is issued to give this LS-170F new unique address, it will lower its *A out* pin. Connecting *A out* pin to the *A in* pin of the next servo drive in the network will enable its communication at default address of 0x00. Repeating this process allows a variable number of controllers present to be given unique addresses.

In addition to the individual address, each controller has a *secondary group address*. Several LS-170F controllers may share a common group address. This address is useful for sending commands, which must be performed simultaneously by a number of drivers (e.g. *Start motion*, *Set Baud Rate*, etc.). When a LS-170F receives a command sent to its group address, it will execute the command but not send back a status packet. This prevents data collisions on the shared response line. In programming group addresses, however, the host can specify that one member of the group is the "group leader". The group leader will send back a status packet just like it would for a command sent to its individual address. The group address is programmed at the same time as the unique individual address using the *Set Address* command.

Multiple Controller Configuration

## CHANGING COMMUNICATION RATES

The default baud rate after power-up is 19.2 Kbps. Baud rates up to 115.2 Kbps may be used at maximum servo rate. After communication has been established with all servo drives on a single network, the baud rate may be changed to a higher value with the *Set Baud Rate* command.

### Servo Control

LS-170F uses a “proportional-integral-derivative”, or PID filter. The position, velocity and acceleration are programmed as 32-bit quantities in units of encoder counts for servo ticks. For example, a velocity of one revolution per second of a motor with a 500 line encoder (2000 counts/rev) at a tick time of 0.512 msec would correspond to a velocity of 1.0240 counts/tick. Velocities and accelerations use the lower 16 bits as a fractional component so that the actual programmed velocity would be  $1.024 \times 2^{16}$  or 67,109. An acceleration of 4 rev/sec/sec (which would bring us up to the desired speed in  $\frac{1}{4}$  sec) would be 0.0021 counts/tick/tick; with the lower 16 bits the fractional component, this would be programmed as  $0.0021 \times 2^{16}$  or 137. Position is programmed as a straight 32-bit quantity with no fractional component. Note that if the servo rate divisor is modified, the time dependent velocity and acceleration parameters will also have to be modified.

## DAC MODE OPERATION

If the position servo is disabled, the motion control node is operated in a raw DAC output mode and no trapezoidal or velocity profiling is performed. In this mode, a user specified PWM value is converted directly to an output voltage. Setting the PWM (refer to *Load Trajectory* command in *Command Description* section in this document) value in the range of  $0 \div \pm 255$  corresponding to output voltage in the range of  $0 \div \pm 10V$ . Command position is continually updated to match the actual position of the motor and there will be no abrupt jump in the motor’s position when position or velocity modes are entered. Also while the position servo is disabled, the command velocity is continually updated to match the actual velocity of motor. Thus, when velocity mode is entered, there will be no discontinuity in the motor’s velocity. (Trapezoidal profile motions, however, will still force the motor to begin at zero velocity).

## SAFETY FEATURES AND DIAGNOSTIC

To protect both the user device and the controller, LS-170F is equipped with various safety features.

### **STP IN – Stop Input**

If STP IN is open the ENABLE (EN) will be open and Vout will be set to 0V ± OFFSET. For diagnostic refer to *Status bits and LEDS* section of this document.

### **Encoder Control.**

Using differential encoder provides protection against motor windup caused by missing or broken encoder wire. A dedicated logic controls the presence of all encoder signals. Detecting a missing signal is considered as Encoder Error (refer to *Status Bits and Led* section in this document).

### **System Status**

**Stop Motor command** - refer to *Stop motor* command (page 21):

**Bit 0** – Pic\_ae.

**Auxiliary Status byte** diagnostic bits - refer to *Read status* command (page 19) and *Status byte and Auxiliary status byte definitions* (page 23):

**Bit 0** – Index;

**Bit 2** – Servo\_on.

**Status byte** diagnostic bits - refer to *Read status* command (page 19) and *Status byte and Auxiliary status byte definitions* (page 23):

**Bit 3** – Power\_on;

**Bit 4** – Pos\_error;

**Bit 5** – Limit 1 (Reverse);

**Bit 6** – Limit 2 (Forward).

### Diagnostic bits

Status Bit 6 Limit 2	Status Bit 5 Limit 1	Status Bit 4 Pos_error	Status Bit 3 Power_on	Auxiliary Bit 2 Servo_on	Auxiliary Bit 0 Index	Stop Cmd Bit 0 Pic_ae	CONDITION	LS-173F with Orange and Green LEDs	LS-173F with RED LED	BRAKE OUT
1	1	X	1	0	1	0	Servo OFF, Amplifier OFF	Orange	Low intensity	Off
For limit	Rev limit	0*	1	1	Encoder	1	Servo ON, Amplifier ON	Green	High intensity	On
				0			Servo OFF, Amplifier ON			
1	0	X	1	0	1	0	STOP input activated	Orange	Low intensity	Off
1	0	1	0	0	1	1	STOP input activated (lathced)*			
0	1	1	0	0	1	1	Motor short/Overvoltage*			
1	0	1	0	0	0	1	Encoder error*			
X	X	1	1	0	X	1	Position error*			

\*To restore the normal operation:

- Set to 0 Pic\_ae (*Stop motor* command page 21);
- Send *Clear sticky bits* command (page 23);
- If there is no more fault condition, Bit 3 (Power\_on) will be set to 1;
- To turn servo ON set Pic\_ae to 1 (*Stop motor* command page 21).

### **Power-up and Reset Conditions**

On Power-up or reset, the following state is established:

*Motor position is reset to zero;*

*Velocity and acceleration values are set to zero;*

*All gain parameters and limit values are set to zero;*

*The servo rate divisor is set to 1 (0.512msec servo rate);*

*The PWM value is set to zero;*

*The controller is placed in PWM mode;*

*The default status data is the status byte only;*

*The individual address is set to 0x00 and the group address to 0xFF (group leader not set);*

*Communications are disabled pending a low value of "A in";*

*The baud rate is set to 19.2 KBPS;*

*In the status byte, the move\_done and pos\_error flags will be set and the current\_limit and home\_in\_progress flags will be clear;*

*In the auxiliary status byte, the pos\_wrap, servo\_on, accel\_done, slew\_done and servo\_overrun flags will be cleared.*

## THEORY OF OPERATION

LS-170F can operate in two different modes – normal and advanced. In normal mode the command set is fully compatible with LS-170F command specification. Advanced mode is intended for coordinated motion control and includes different enhancements.

Relative Zero Position The position counter in the LS-170F can optionally be reset relative to the last position captured in the home position register. This relieves the user from having to calculate goal positions relative to the home position. Please refer to the *Command Specification* section below.

Relative Moves The LS-170F can optionally be commanded to move relative to its current command position. This relieves the user from the additional calculations and bookkeeping otherwise required to implement relative moves. Please refer to the *Command Specification* section below.

Improved Index Latching The LS-170F homing function will trigger on any index pulse longer than 120 nanoseconds. Note, however, that the positions are still only updated every 512 microseconds, and that the most accurate homing will require a motor speed of less than 1 encoder count per 512 microseconds.

### **Coordinated motion control**

LS-170F contains a path point buffer with room for 96 entries. Each entry is a goal position for the motor. When the *Servo Drive* enters its special path mode, it will automatically move from one point to the next at a user selectable rate of either 30 or 60 Hz\*. The Servo Drive moves the motor between goal points at a constant velocity such that it always arrives at the next path point in exactly 1/30<sup>th</sup> or 1/60<sup>th</sup> of a second. When sets of path points are downloaded into multiple controllers, and then the paths started simultaneously, the individual axes will execute their paths with exact\*\* synchronization.

The path point buffer has room for about 3 seconds worth of motion for a 30 Hz path and about 1.5 seconds for a 60 Hz path. Typically, the host computer downloads the first part of a path to the LS-170F buffers and then starts the path mode. As the buffers become depleted, additional path points are dynamically added while the axes are still in motion, until the path is complete. The timing requirements for the host require that it be able to dynamically download new path points before the path point buffers empty completely. With a path point buffer size of 1.5 or 3 seconds, even a non-real time host, such as a PC running Windows, can easily keep up with the task of re-filling the path point buffers as needed.

The actual multi-axis paths, which are downloaded into the LS-170F path point buffers, are calculated by the host computer. In addition to creating the geometry desired (arcs, lines, etc.), the path should be smooth, adhering to the physical acceleration and velocity limits of the motors being controlled. Because the host computer actually creates the paths, any path the user can create can be executed, and paths can involve up to 31 axes. Most typically, coordinated straight-line motions, 2-axis circular motions, or S-curve profiling motions are created.

Note that motions created with the path mode are independent of any acceleration or velocity values loaded using the Load Trajectory command.

### **Path Accuracy**

The path accuracy of the LS-170F Servo Drive is more than adequate for most CNC machine control or robot control applications. For very high speed or very high accuracy applications, however, there are two types of path errors to consider: absolute path errors and timing errors.

### **Absolute Path Errors**

Absolute path accuracy is the accuracy with which a series of calculated path points with straight line segments between them matches the actual curved path desired. For example, a circle, which is

---

\* In "fast path" mode, the path rates can be selected as either 60 or 120 Hz. The default "slow path" mode is more than adequate for most applications, and requires less communications overhead.

\*\* The exactness of the synchronization is subject to crystal frequency accuracy and other timing factors discussed later.

approximated by only 5 path points, will form a pentagon rather than a circle. The maximum error between the side of the pentagon and the circle may be quite large. A larger number of path points will produce a smaller error. In general, accuracy of an approximated path will be a function of the number of path points used, and the radius of the curve.

Because LS-170F uses a fixed number of points per second, moving more slowly will result in a more accurate path than moving quickly. Also, a 60 Hz path will be more accurate than a 30 Hz path. The main advantages of using a slower path, however, are that fewer path points need to be calculated, less data needs to be sent to the controllers, and the path point buffer will last twice as long.

The maximum absolute path error can be approximated by the formula:

$$\text{Error} = R \times ( 1 - \cos( V / ( 2 \times F \times R ) ) )^*$$

where R is the radius of the curve (in inches), V is the velocity of the motion (in inches/sec), and F is the path point frequency (30, 60 or 120 Hz). For example, a one-inch diameter circle with a velocity of 1 inch per second and a path frequency of 30 Hz would have a maximum error of 0.00028 inches. If a frequency of 60 Hz is used, the maximum error drops to 0.000069 inches.

## Timing errors

If the timing of multiple axes is not perfectly synchronized, there will be a deviation from the desired path from the fact that one axis will be ahead or behind in time. The exact deviation will depend on the path geometry.

The first type of timing error results from multiple axes not starting at exactly the same time. When a "start path" command is issued to a group of controllers, they will all start within +/- 0.00025 seconds of one another.

The second type of timing error results from inaccuracies in the frequencies of the oscillators running on each *LS-170F* controller. (If all Servo Drives are timed from the same oscillator, this error is zero.) Typical oscillator variations (for the same operating temperature) are about 10 parts per million. Therefore, after running a path for 10 seconds, for example, the timing error would be about +/- 0.0001 seconds.

By adding both of these timing errors together, and then multiplying by the path velocity, we get the total distance that one axis can be ahead of another axis. For a 10 second motion, while moving at 1 inch per second, we could have one axis moving ahead of another by at most 0.00035 inches. The actual worst case deviation (moving along a 45 degree angle) will produce an error from the ideal path of 0.00025 inches. Over a total distance of 10 inches traveled, this gives a basic accuracy of ±0.000025 inches per inch of travel. Other examples, of course, will produce different accuracy figures.

Note that errors due to timing only accumulate during a coordinated motion and are, in essence, reset with each new move. Therefore, if errors due to timing do become a problem, the paths should be broken up into shorter moves.

\* The cosine function should be executed for an angle in radians.

## COMMAND SPECIFICATION

### List of Commands

Command	CM D Cod e	# Data byte s	Description	While Moving?
Reset position	0x0	0-1	Sets position counter to zero.	No
Set address	0x1	2	Sets the individual and group addresses	Yes
Define status	0x2	1	Defines which data should be sent in every status packet	Yes
Read status	0x3	1	Causes particular status data to be returned just once	Yes
Load trajectory	0x4	1-14	Loads motion trajectory parameters	Maybe*
Start motion	0x5	0	Executes the previously loaded trajectory	Maybe**
Set gain	0x6	14	Sets the PID gains and operating limits	Yes
Stop motor	0x7	1	Stops the motor in one of three manners	Yes
I/O control	0x8	1	Not used	
Set home mode	0x9	1	Sets conditions for capturing the home position	Yes
Set baud rate	0xA	1	Sets the baud rate (group command only)	Yes
Clear bits	0xB	0	Clears the sticky status bits	Yes
Save as home	0xC	0	Saves the current position in the home position register	Yes
Add path points	0xD	0-14	Adds path points to the device buffer.	Yes
Nop	0xE	0	Simply causes the defined status data to be returned	Yes
Hard reset	0xF	0	Resets the controller to its power-up state.	Yes

\*Only allowed while moving if the "start motion now" bit of the trajectory control word is not set or if the "profile mode" bit is set for velocity mode.

\*\*Only allowed while moving if the previously loaded trajectory has the "profile mode" bit set for velocity mode.

### Command Description

#### **Reset Position**

Command value:           0x0  
 Number of data bytes:    0 or 1  
 Command byte:            0x00 or 0x10

Data bytes:

1. Control byte:

Bit    0:       resets current position relative to home position  
       1-7       not used (clear to 0)

#### Description:

Resets the 32-bit encoder counter. If bit 0 in the control byte is set, current position will be set to the difference between old current position and the home position. Otherwise, new current position will be zero. Do not issue this command while executing a trapezoidal profile motion.

## Set Address

Command value: 0x1  
Number of data bytes: 2  
Command byte: 0x21

### Data bytes:

1. Individual address: 0x01-0x7F (initial address 0x00)  
Group Address: 0x80-0xFF (initial value 0xFF)

### Description:

Sets the individual address and group address. Group addresses are always interpreted as being between 0x80 and 0xFF. If a Drive is to be a group leader, clear bit 7 of the desired group address in the second data byte. The module will automatically set bit 7 internally after flagging the Drive as a group leader. (If bit 7 of the second data byte is set, the module will default to being a group member.) The first time this command is issued after power-up or reset, it will also enable communications for the next Drive in the network chain by lowering the it's "A out" signal.

## Define Status

Command value: 0x2  
Number of data bytes: 1  
Command byte: 0x12

### Data bytes:

1. Status items: (default: 0x00)

Bit 0: send position (4 bytes)  
1: send A/D value (1 byte)  
2: send actual velocity (2 bytes - no fractional component)  
3: send auxiliary status byte (1 byte)  
4: send home position (4 bytes)  
5: send device ID and version number (2 bytes)  
(motor controller device ID = 0, version number = 70 to 79)  
6: send current position error (2 bytes)  
7: send number of points in the path buffer\*

### Description:

Defines what additional data will be sent in the status packet along with the status byte. Setting bits in the command's data byte will cause the corresponding additional data bytes to be sent after the status byte. The status data will always be sent in the order listed. For example if bits 0 and 3 are set, the status packet will consist of the status byte followed by four bytes of position data, followed by the aux. status byte, followed by the checksum. The status packet returned in response to this command will include the additional data bytes specified. On power-up or reset, the default status packet will include only the status byte and the checksum byte.

Note: The actual velocity is a positive number when moving in reverse direction and a negative number when moving in forward direction.

---

\* In advanced mode only.

## Read Status

Command value: 0x3  
Number of data bytes: 1  
Command byte: 0x13

Data bytes:

1. Status items:

Bit 0: send position (4 bytes)  
1: send A/D value (1 byte)  
2: send actual velocity (2 bytes - no fractional component)  
3: send auxiliary status byte (1 byte)  
4: send home position (4 bytes)  
5: send device ID, version number (2 bytes)  
(Motor controller device ID = 0, version number = 70 to 79)  
6: send current position error (2 bytes)  
7: send number of points in the path buffer\*

### Description:

This is a non-permanent version of the *Define Status* command. The status packet returned in response to this command will incorporate the data bytes specified, but subsequent status packets will include only the data bytes previously specified with the *Define Status* command.

Note: The actual velocity is a positive number when moving in reverse direction and a negative number when moving in forward direction.

\* In advanced mode only.

## Load Trajectory

Command value: 0x4  
Number of data bytes:  $n = 1-14$   
Command byte: 0xn4

Data bytes:

1. Control byte:

Bit 0: load position data ( $n = n + 4$  bytes)  
1: load velocity data ( $n = n + 4$  bytes)  
2: load acceleration data ( $n = n + 4$  bytes)  
3: load PWM value ( $n = n + 1$  bytes)  
4: servo mode - 0 = PWM mode, 1 = position servo  
5: profile mode - 0 = trapezoidal profile, 1 = velocity profile  
6: in velocity/PWM mode direction flag 0 = FWD, 1 = REV  
in trapezoidal mode 0 = absolute, 1 = relative\*  
7: start motion now

\* In advanced mode only.

### Description:

All motion parameters are set with this command. Setting one of the first four bits in the control byte will require additional data bytes to be sent (as indicated) in the order listed. The position data (range  $\pm 0x7FFFFFFF$ ) is only used as the goal position in trapezoidal profile mode. The velocity data (range 0x00000000 to 0x7FFFFFFF) is used as the goal velocity in velocity profile mode or as the maximum velocity in trapezoidal profile mode. Velocity is given in encoder counts per servo tick, multiplied by 65536. The acceleration data (range 0x00000000 to 0x7FFFFFFF) is used in both trapezoidal and velocity profile mode. Acceleration is given in encoder counts per servo tick per servo tick, multiplied by 65536. The PWM value (range 0x00 - 0xFF), used only when the position servo is not operating, sends a raw PWM value directly to the amplifier. The PWM value is reset to 0 internally on any condition, which automatically disables the position servo.

\* While the position may range from -0x7FFFFFFF to +0x7FFFFFFF, the goal position should not differ from the current position by more than 0x7FFFFFFF.

Bit 4 of the control byte specifies whether the position servo should be used or if the PWM mode should be entered. Bit 5 specifies whether a trapezoidal profile motion should be initiated or if the velocity profiler is used. Trapezoidal profile motions should only be initialized when the motor velocity is 0. (Bit 0 of the status byte indicates when a trapezoidal profile motion has been completed, or in velocity mode, when the command velocity has been reached.) Bit 6 indicates the velocity or PWM direction. In trapezoidal profile mode, this bit indicates whether position data is absolute (if bit 6 = 0) or relative to the current position. This feature is available in advanced mode only. If bit 7 is set, the command will be executed immediately. If bit 7 is clear, the command data will be buffered and it will be executed when the *Start Motion* command is issued. For example to load only new position data and acceleration data but not to start the motion yet, the command byte would be 0x94, the control byte would be 0x15, followed by 4 bytes of position data (least significant byte first), followed by 4 bytes of acceleration data.

If in the middle of a trapezoidal position move, a new *Load Trajectory* command is issued with new position data downloaded, new position data will be used as a relative offset to modify the goal position. For example, if in the middle of a move to position 50,000, a new *Load Trajectory* command with new position data of 10,000 is loaded, the motor will stop at final position of 60,000. The relative offset can be either positive or negative. The new *Load Trajectory* command must be issued while the motor is running at a constant velocity – issuing the command while accelerating or decelerating will cause a position error to occur. If more than one *Load Trajectory* is issued before the end of move, the goal position will be modified by the sum of relative offsets.

## Start Motion

*Command value:* 0x5  
*Number of data bytes:* 0  
*Command byte:* 0x05

### Description:

Causes the trajectory information loaded with the most recent Load Trajectory command to execute. This is useful for loading several Drives with trajectory information and then starting them simultaneously with a group command.

## Set Gain

*Command value:* 0x6  
*Number of data bytes:* 14  
*Command byte:* 0xE6

### *Data bytes:*

- 1,2. *Position gain KP (0 - 0x7FFF)*
- 3,4. *Velocity gain KD (0 - 0x7FFF)*
- 5,6. *Integral gain KI (0 - 0x7FFF)*
- 7,8. *Integration limit IL (0 - 0x7FFF)*
9. *Output limit OL (0 - 0xFF) (typically recommended 0xFA)*
10. *Current limit CL (0 - 0xFF) (only odd values)*
- 11,12. *Position error limit EL (0 - 0x3FFF)*
13. *Servo rate divisor SR (1 - 0xFF)*
14. *Amplifier deadband compensation (0 - 0xFF) (typical value is between 0x03 and 0x05)*

## Description:

Sets all parameters and limits governing the behavior of the position servo. KP, KD, KI and IL are PID filter parameters. OL limits the maximal PWM output value to  $0 < \text{PWM} \leq \text{OL}$  in position servo modes. In PWM mode OL is ignored. CL is used for motor current limitation (refer to *Motor current monitoring* in *Safety Features* for detailed information). Setting CL=0 effectively disables current limiting. The position error limit (EL) will cause the position servo to be disabled should the position error grow beyond the limit. The servo rate divisor sets the servo tick time to be a multiple of 0.512 msec (1.953 KHz). For example SR=3 gives a servo rate of 651 Hz. The servo tick rate is also used as the profiling timebase, although command processing and current limiting are always performed at the maximum tick rate. Sometimes it is necessary to compensate the deadband region around zero PWM output exhibited by some amplifier/motor combinations. The deadband compensation value will be added to the magnitude of the PWM output to force the amplifier into its active region.

## **Stop Motor**

Command value: 0x7  
Number of data bytes: 1 or 5  
Command byte: 0x17 or 0x57

### Data bytes:

#### 1. Stop control byte

Bit 0: Pic\_ae (Power Driver enable)  
1: Turn motor off  
2: Stop abruptly  
3: Stop smoothly  
4: Stop here  
5: Enable advanced features  
6-7: Unused (set to 0)

2-5. Stopping position (only required if bit 4 above is set)

### Description:

Stops the motor in the specified manner. If bit 0 of the Stop Control Byte is set, Power Driver will be enabled. If bit 0 is cleared Power Driver will be disabled, regardless of the state of the other bits. Pic\_ae also controls the meaning of bit 3 (Power\_on), bit 5 (Limit1 (Reverse)), and bit 6 (Limit 2 (Forward)) of status byte (refer to *Status Bits of Safety Features* section in this document). If bit 1 is set, the position servo will be disabled, the PWM output value will be set to 0, and bits 2, 3 and 4 are ignored. If bit 2 is set, the current command velocity and the goal velocity will be set to 0, the position servo will be enabled, and velocity mode will be entered. If the velocity servo was previously disabled, the motor will simply start servoing to its current position. If the motor was previously moving in one of the profiling modes, it will stop moving abruptly and servo to its current position. This stopping mode should only be used as an emergency stop where the motor position needs to be maintained. Setting bit 3 enters a more graceful stop mode - this sets the goal velocity to 0 and enters velocity mode, causing the motor to decelerate to a stop at the current acceleration rate. If bit 4 is set, the motor will move to the specified stopping position abruptly with no profiling. This mode can be used to cause the motor to track a continuous string of command positions. Note that if the stopping position is too far from the current position, a position error will be generated. Only one of the bits 1, 2, 3 or 4 should be set at the same time. The *Stop Motor* command must be issued initially to set Pic\_ae before other motion commands are issued.

Bit 5 enables advanced features of the LS-170F. Advanced features will stay enabled regardless of subsequent stop commands, until the drive is reset.

## I/O Control

Command value: 0x8  
Number of data bytes: 1  
Command byte: 0x18

### Data bytes:

1. I/O control byte
- Bit 0-3: Reserved set to 1  
4-5: Unused (set to 0)  
6: Fast path mode (0 = 30/60 Hz, 1 = 60/120 Hz)  
7: Unused (set to 0)

### Description:

Bit 6 controls whether the drive is in slow path mode (bit 6 = 0) or fast path mode when the drive is in advanced mode.

## Set Homing Mode

Command value: 0x9  
Number of data bytes: 1  
Command byte: 0x19

### Data bytes:

1. Homing control byte
- Bit 0: Capture home position on change of Limit 1 (Reverse)  
1: Capture home position on change of Limit 2 (Forward)  
2 Turn motor off on home  
3: Capture home on change of Index  
4: Stop abruptly on home  
5: Stop smoothly on home  
6: Capture home position when an excess position error occurs  
7: Capture home position when current limiting occurs

### Description:

Causes the Drive to monitor the specified conditions and capture the home position when any of the flagged conditions occur. The home\_in\_progress bit in the status byte is set when this command is issued and it is then lowered the home position has been found. Setting one (and only one) of bits 2, 4 or 5 will cause the motor to stop automatically in the specified manner once the home condition has been triggered. This feature can also be used as a safety shutoff.

*Note: For homing with Index signal, use low velocities, which ensure the time of the Index pulse is at least one servo tick (0.512 msec). The maximum theoretical homing velocity is 65536 (one encoder count per servo tick). Depending of motor vibrations, the homing velocity should be less than 65536. A recommended homing velocity is 16384 (0.25 encoder counts per servo tick).*

## Set Baud Rate

Command value:	0xA	sample values:	
Number of data bytes:	1	9600	BRD = 0x81
Command byte:	0x1A	19200	BRD = 0x3F
Data bytes:		57600	BRD = 0x14
1. Baud rate divisor, BRD		115200	BRD = 0x0A

### Description:

Sets the communication baud rate. All drives on the network must have their baud rates changed at the same time; therefore this command should only be issued to a group including all of the controllers on the network. A status packet returned from this command would be at the new baud rate, so typically (unless the host's baud rate can be accurately synchronized) there should be no group leader when this command is issued.

# Logosol Motion Control Node LS-170F

Doc #712170002 / Rev. B, 10/29/2004

bits are shifted to the left, and bit 2 is always zero. As with all other types of multi-byte data, the least significant byte is always sent first.

To actually start execution of the path in the path point buffer, an Add Path Points command is issued with no path point data included. To start several LS-170F controllers simultaneously, the Add Path Points command (with no path point data) should be sent to the group address of the group containing all the LS-170F controllers involved.

If "fast path" mode has been selected using the I/O Control command, bit F will be set to 0 for 120 Hz or 1 for 60 Hz, and the path point data will have the following format:

60 Hz Path (fast path mode): P<sub>12</sub> P<sub>11</sub> P<sub>10</sub> P<sub>9</sub> P<sub>8</sub> P<sub>7</sub> P<sub>6</sub> P<sub>5</sub> P<sub>4</sub> P<sub>3</sub> P<sub>2</sub> P<sub>1</sub> P<sub>0</sub> 0 F D  
*most significant byte* *least significant byte*

120 Hz Path (fast path mode): P<sub>11</sub> P<sub>10</sub> P<sub>9</sub> P<sub>8</sub> P<sub>7</sub> P<sub>6</sub> P<sub>5</sub> P<sub>4</sub> P<sub>3</sub> P<sub>2</sub> P<sub>1</sub> P<sub>0</sub> 0 0 F D  
*most significant byte* *least significant byte*

## No Operation

Command value: 0xE  
Number of data bytes: 0  
Command byte: 0x0E

### Description:

Does nothing except cause a status packet with the currently defined status data to be returned.

## Hard Reset

Command value: 0xF  
Number of data bytes: 0  
Command byte: 0x0F

### Description:

Resets the control module to its power-up state. No status will be returned. Typically, this command is issued to all the modules on the network, although if the baud rate is set at the default, it is possible to reset and re-initialize the addresses of a contiguous sub-chain of modules.

## STATUS BYTE AND AUXILIARY STATUS BYTE DEFINITIONS

### Status Byte

<u>Bit</u>	<u>Name</u>	<u>Definition</u>
0	Move_done	Clear when in the middle of a trapezoidal profile move or in velocity mode, when accelerating from one velocity to the next. This bit is set otherwise, including while the position servo is disabled
1	Cksum_error	Set if there was a checksum error in the just received command packet
2	Current_limit	Set if current limiting has exceeded (refer to <i>Motor Current Monitoring</i> section in this document). Must be cleared by user with <i>Clear Sticky Bits</i> command
3	Power_on/diag. bit	Refer to <i>Status Bits and LED</i> section in this document
4	Pos_error	Set if the position error has exceeded the position error limit. It is also set whenever the position servo is disabled. Must be cleared by user with <i>Clear Sticky Bits</i> command
5	Limit 1 (Reverse)/ diag. bit	Reverse Limit or diagnostic bit (refer to <i>Status Bits and LED</i> diag. bit section in this document).
6	Limit 2 (Forward)/ diag. bit	Forward Limit or diagnostic bit (refer to <i>Status Bits and LED</i> diag. Bit section in this document).
7	Home_in_progress	Set while searching for a home position. Reset to zero once the home position has been captured

### Auxiliary Status Byte

<u>Bit</u>	<u>Name</u>	<u>Definition</u>
0	Index/diag. bit	Compliment of the value of the index input or diagnostic bit (refer to <i>Status Bits and LED</i> section in this document).
1	Pos_wrap	Set if the 32-bit position counter wraps around. Must be cleared with the <i>Clear Sticky Bits</i> command
2	Servo_on	Set if the position servo is enabled, clear otherwise
3	Accel_done	Set when the initial acceleration phase of a trapezoidal profile move is completed. Cleared when the next move is started
4	Slew_done	Set when the slew portion of a trapezoidal profile move is complete. Cleared when the next move is started.
5	Servo_overnun	At the highest baud rate and servo rate, certain combinations of calculations may cause the servo, profiling, and command processing to take longer than 0.512 msec, in which case, this bit will be set. This is typically not serious, only periodically introducing a small fraction of a millisecond delay to the servo tick time. Cleared with the <i>Clear Sticky Bits</i> command
6	Path mode	Set when the drive is currently executing a path. Cleared when buffer is emptied or Stop Motor or Load Trajectory command is sent.

# Logosol Motion Control Node LS-170F

Doc #712170002 / Rev. B, 10/29/2004

## INITIALIZING PROCEDURE AND PROGRAMMING EXAMPLES FOR SERVO DRIVES

To ensure a proper operation of all Servo drives connected to the network, the following initializing steps should be executed:

Reset all modules with *Hard Reset* command.

Set the addresses for all connected drives.

Set the individual gains (KP, KD, KI, IL, OL, CL, EL, SR and DB). Minimal requirements are: KP <> 0, EL <> 0 and SR <> 0.

Use *Load trajectory* command to set the target position, velocity acceleration with start motion now in trapezoidal mode. Minimal requirements are acceleration <> 0 and target position = 0. This command does not start any motion. It is necessary to initialize internal registers of the module.

Close the servo loop by using *Stop Motor* command (Pic\_ae=1 and Stop abruptly=1).

Understanding the Serial Communication with Servo drives

The Serial Communication with Servo drives is strictly master-slave and matches repeatedly two elements:

- Sending a command to the specified drive's address;
- Receiving answer to the sent command – Status Byte(s).

*Note: During the communication all bytes are sent with LSB first.*

### Commands

There are 16 commands managing Servo drives (refer to Command Description). Each command as shown in the following two tables includes header, address, command, data bytes and one checksum byte. Checksum does not include header byte.

#### Structure of Read Status command

Byte 1	Byte 2	Byte 3		Byte 4	Byte 5
Header	Address (Individual or Group)	Command Code		Data Byte	Checksum = Byte 2 + Byte 3 + Data Byte
		High 4 bits No. of data bytes	Low 4 bits command code		
AA	01	1	3	01	15

### Examples

Cmd. Bytes	Byte 1	Byte 2	Byte 3	Byte 4 – N	Byte N+1
Command	Header	Address	Cmd. Code	Data Byte(s)	Checksum
Reset position	AA	01	0 0		01
Define status	AA	05	1 2	05	1C
Set address	AA	01	2 1	07 FF	21
Load trajectory	AA	01	5 4	91 00 28 00 00	0E
Set gain	AA	01	E 6	64 00 00 04 00 00 00 00 FF 00 00 08 01 00	57

### Status Data

The structure of the returned status information depends on *Define Status* or *Read Status* commands (refer to Command Description). By default only the Status byte and Checksum are returned to the host.

### Examples

Byte 1	Optional Bytes 0-16	CheckSum
Status Byte	Additional Status Bytes as position, velocity, home position, A/D auxiliary byte, version and position error.	Checksum = Byte 1+ Optional Bytes
09	no additional status bytes requested	09
09	00 28 00 00 – four additional status bytes	31

### Addressing

Each drive in the daisy-chained network has two addresses:

# Logosol Motion Control Node LS-170F

Doc #712170002 / Rev. B, 10/29/2004

- Individual - for individual control of each drive. Its range is from 01h to 7Fh.
  - Group - for simultaneous control of all group members by sending a single command to their group address. It is in the range of 80h to FFh.
- Both these addresses have to be set during the initialization process.

The group may have Group leader responsible to send status data. Its address is:

$$\text{Group leader address} = \text{Group address} - 80\text{h.}$$

If there is no group leader - no status data will be send after a group command.

*Set Baud Rate* command must be sent only as a group command with no group leader, otherwise communication problems may occur.

## Set Address command format

Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6
Header	Preset Address	Command code	Individual Address	Group Address	Checksum
AA	00	21	01	FF	21

## Setting the Addresses

After power-up and *Hard Reset* command all drives have their address set to 00h and only the first drive (starting from the host) has its communication enabled. Consecutive *Set Address* commands are sent to address 00h until all drives are addressed. This procedure can be executed once after *Hard Reset*. The table below shows the steps to address 3-drives network.

Example of sequential addressing for three Servo drives

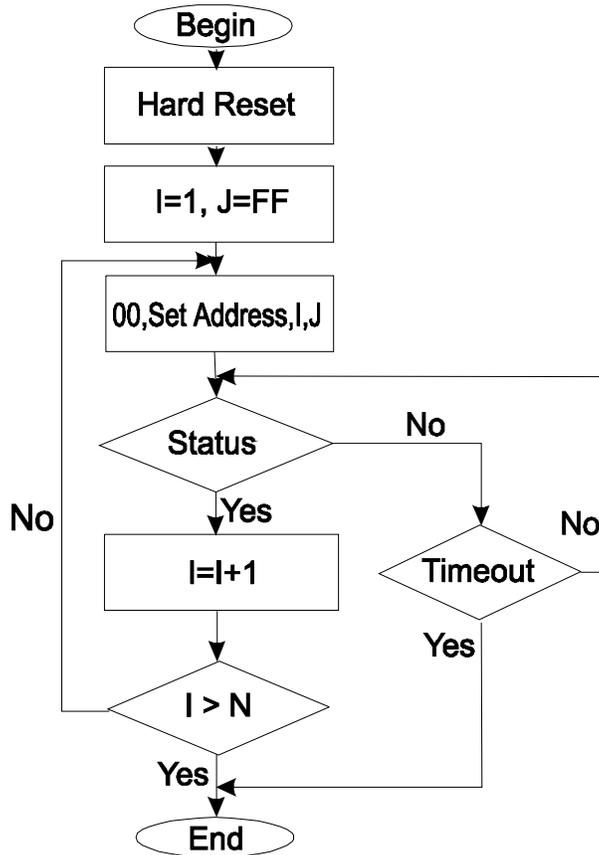

Step	Command	Set address Hexadecimal Code	Drive 1		Drive 2		Drive 3	
			Individual address	Group address	Individual address	Group address	Individual address	Group address
0	Power-up							
1	Hard Reset	AA FF 0F 0E	address=00 communication <i>enabled</i>		address=00 communication <i>disabled</i>		address=00 communication <i>disabled</i>	
2	Set Address Drive1 = 01	AA 00 21 01 FF 21	01	FF	address=00 communication <i>enabled</i>		address=00 communication <i>disabled</i>	
3	Set Address Drive2 = 02	AA 00 21 02 FF 22	01	FF	02	FF	address=00 communication <i>enabled</i>	
4	Set Address Drive3 = 03	AA 00 21 03 FF 23	01	FF	02	FF	03	FF

*Note:* Before start addressing *Hard Reset* command must be issued.

# Logosol Motion Control Node LS-170F

Doc #712170002 / Rev. B, 10/29/2004

The flowchart shows the addressing procedure of N drives network. There is no group leader and the group address is FF.

*I* - Individual Address; *J* - Group Address = FF;  
*Status* - Status Data sent to the Host; *Timeout* - Greater than one servo circle.

# Logosol Motion Control Node LS-170F

Doc #712170002 / Rev. B, 10/29/2004

## Examples of Managing Two Servo Drives

- # 1 – Resets all modules with group command.
- # 2 and # 3 - Set the addresses of drives 1 and 2.
- # 4 and # 6 - Set PID parameters of drives 1 and 2.
- # 6 and # 7 - Starts motion in trapezoidal mode with target position=0, velocity=0, acceleration=1 and PWM=0.
- # 8 and # 9 - Close servo loops of drives 1 and 2. Initialization is complete at this point.
- # 10 and # 10 - Load trajectories (positions, velocities and accelerations) for drives 1 and 2.
- # 12 and # 13 - Load and execute new trajectory for drive 1.
- # 14 and # 15 - Read additional status bytes from drives 1 and 2.
- # 16, # 17 and #18 - Load new trajectories for drives 1 and 2 and execute them with one command sent to the drives' group address.

## Examples

#	Hexadecimal code of command	Comments
1	AA FF 0F 0E	<i>Hard Reset</i>
2	AA 00 21 01 FF 21	<i>Set Address 01h for drive 1. Group address=FFh.</i>
3	AA 00 21 02 FF 22	<i>Set Address 02h for drive 2. Group address=FFh.</i>
4	AA 01 E6 64 00 00 04 00 00 00 00 FF 00 00 08 01 00 57	<i>Set Gains of drive 1 – defines PID parameters: KP=64h, KI=400h, KI=00h, IL=00h, OL=FFh, CL=00h, EL=800h, SR=01h, DC=00h.</i>
5	AA 02 E6 64 00 00 04 00 00 00 00 FF 00 00 08 01 00 58	<i>Set Gains of drive 2 – defines PID parameters: KP=64h, KI=400h, KI=00h, IL=00h, OL=FFh, CL=00h, EL=800h, SR=01h, DC=00h.</i>
6	AA 01 E4 9F 00 00 00 00 00 00 00 00 01 00 00 00 00 85	<i>Load trajectory for drive 1 – target position=0, velocity=0, acceleration=1, PWM=0 and start motion now</i>
7	AA 02 E4 9F 00 00 00 00 00 00 00 00 01 00 00 00 00 86	<i>Load trajectory for drive 2 – target position=0, velocity=0, acceleration=1, PWM=0 and start motion now</i>
8	AA 01 17 05 1D	<i>Stop Motor - closes servo loop of drive 1 with Power Driver enable and Stop Abruptly in Command byte.</i>
9	AA 02 17 05 1E	<i>Stop Motor - closes servo loop of drive 2 with Power Driver enable and Stop Abruptly in Command byte.</i>
10	AA 01 E4 9F 00 00 00 00 00 80 01 00 64 00 00 00 00 69	<i>Load Trajectory of drive 1 with Pos=0000h, Vel=18000h, Acc=6400h, PWM=00h, servo mode=1.</i>
11	AA 02 E4 9F 00 00 00 00 00 80 01 00 64 00 00 00 00 6A	<i>Load Trajectory of drive 2 with Pos=0000h, Vel=18000h, Acc=6400h, PWM=00h, servo mode=1.</i>
12	AA 01 54 11 00 28 00 00 8E	<i>Load Trajectory of drive 1 with new position=2800h.</i>
13	AA 01 05 06	<i>Start Motion - executes previously loaded trajectory.</i>
14	AA 01 13 05 19	<i>Read Status from drive 1 (plus position and velocity).</i>
15	AA 02 13 05 1A	<i>Read Status from drive 2 (plus position and velocity).</i>
16	AA 01 54 11 20 4E 00 00 D4	<i>Load Trajectory of drive 1 with new position=4E20h.</i>
17	AA 02 54 11 E0 B1 FF FF F6	<i>Load Trajectory of drive 2 with new position=FFFFB1E0h (-4E20h).</i>
18	AA FF 05 04	<i>Start Motion – executes previously loaded trajectories. The command is sent to the drives' group address FFh.</i>

# Logosol Motion Control Node LS-170F

Doc #712170002 / Rev. B, 10/29/2004

## Procedure Initialize

AA FF 0F 0E	Hard reset
AA 00 21 01 FF 21	Set address
AA 00 21 02 FF 22	Search for more modules until no response received
AA 01 13 20 34	Read Device ID and Version number
AA 01 13 FF 13	Read all status data
AA 01 E6 64 00 00 04 00 00 00 00 FF 00 00 08 01 00 57	Set Gain parameters
AA 01 E4 9F 00 00 00 00 00 00 00 00 01 00 00 00 00 85	Set Trajectory parameters
AA 01 17 05 1D	Close servo loop

## Procedure FindHomePosition

AA 01 E6 C8 00 20 03 46 00 28 00 FF 00 40 1F 01 00 9F	Set gain parameters: KP=200, KD=800, KI=70, IL=40, Output limit=255, current limit =0, Position error limit=8000, Servo rate divisor=1 amplifier deadband compensation=0
AA 01 17 09 21	Close the servo loop (Stop smoothly and amplifier enable)
AA 01 94 37 25 06 01 00 58 01 00 00 51	Load trajectory: Velocity mode, Forward direction, Velocity=1 round per second (67109 programmed velocity for 500 line encoder), Acceleration = 10 round per second <sup>2</sup> (344 programmed acceleration for 500 line encoder)
AA 01 19 12 2C	Set home mode - capture home position on change of Limit 1 and stop abruptly
AA 01 05 06	Start motion
wait while home_in_progress bit=1	Home position is found on change of Limit 2
AA 01 19 18 32	Set home mode - capture home position on change of Index and stop abruptly
AA 01 94 77 25 06 01 00 58 01 00 00 91	Load trajectory: Velocity mode, Reverse direction
AA 01 05 06	Start motion
wait while home_in_progress bit=1	Home position is found on change of Index

Calculation of programmed velocity and acceleration for servo rate divisor = 1:

Vel = (encoder counts per revolution) x (number of revolutions per second) x 33.554432

Acc = (encoder counts per revolution) x (number of revolutions per second<sup>2</sup>) x 0.017179869184

For this example:

Vel = 2000 x 1 x 33.554432 = 67109 = 00010625h

Acc = 2000 x 10 x 0.017179869184 = 344 = 00000158h

## Path Mode Example

The table below shows all the data for a smooth trapezoidal path for a single motor moving a carriage from a position of 0.0 to 2.0 inches. A path frequency of 30 Hz is used. (The path point numbers in boldface indicate the periods of acceleration or deceleration.) The last two columns of the table contain (in hex format) the exact position data with the frequency and direction bits set. Assuming that the address for the corresponding motor controller is 0x01, the command string to download the first seven path points would be as follows:

0xAA	Header byte
0x01	Address byte
0xED	Add Path Point Command byte (14 bytes of data)
0x5A 0x00	Path point 1
0xB6 0x00	Path point 2
0x0A 0x01	Path point 3
0x66 0x01	Path point 4
0xBE 0x01	Path point 5
0x1A 0x02	Path point 6
0x6E 0x02	Path point 7
0xBB	8-bit Checksum (does not include header)

Note that less than 7 path points can be added, as long as the upper nibble of the command byte, indicating the number of additional data bytes, is adjusted accordingly. After several path points have been added, you can actually start the path execution by issuing the command string:

0xAA	Header byte
0x01	Address byte
0x0D	Add Path Point Command byte (no additional data)
0x0E	8-bit Checksum (does not include header)

The path will continue to execute as long as new path points are added before the *Servo Drive* reaches the last point added.

### Path Mode Example: Single Axis Trapezoidal Motion

Path Length (inches)	2.00
Encoder counts per inch	10000.00
Maximum Velocity (in/sec)	1.00
Acceleration (in/sec/sec)	2.00
Path Frequency (Hz)	30.00
Tick Time	0.033
Maximum Velocity (counts/tick)	333.333
Acceleration (counts/tick/tick)	22.22
Starting Position (counts)	0.00
Goal Position (counts)	20000.00
